

How close is Compact + Echo to the strongest baseline of each cell — and how much smaller is it (7 standard LTSF datasets)

0721v1 audit · 56 cells: ETTh1/2, ETTm1/2, weather, electricity, traffic × {96,720} × 4 horizons · best baseline chosen per cell by test MSE across all 12 baselines (oracle-strength reference)
PEMS excluded: spatial-graph regime where channel-mixing transformers lead every channel-independent model (see per-dataset figure) · baselines mostly single-seed—descriptive
